

HYDRAULIC CONCRETE CRUSHER

Productivity and time saving for your demolition sites

Hydraulic concrete crusher models are perfect to work with excavators from 13 to 80 tons. With a large jaw opening, the Arden Equipment concrete crusher offers higher productivity than universal or dedicated attachments equipped with concrete jaws.

By allowing scrap metal to be recovered directly on the construction site, they will save significant amounts of time during your recycling tasks.

The configuration of the concrete crusher is customizable through the 2 configurations of jaws that can be mounted on the BBH, which will be chosen according to the desired shredding or the type of waste. They are equipped as standard with a bar cutter inside the jaws close to the rotation axle.

Characteristics

- ✓ Available with or without rotation for recycling and secondary demolition only.
- ✓ Ideal to work on the ground for the recovery of demolition waste, crushing concrete, or the separation of rebars in concrete.

Options :

Booster

The BBH014, BBH020, BBH031 are available with the BOOSTER option, which allows to gain a multiplied force when the jaws are closing. It provides a better cycle time and help reducing energy consumption.

Speedvalve

The speedvalve can be installed on all crushers. It reduces the cycle time of opening and closing the jaws on the demolition tool.

Arden Jet*

This option is available on all crushers. Water is sprayed at high pressure to reduce dust emissions on job sites.

Full plate*

It is used to refine the granulometry.

Teeth*

2 teeth on the BBH1300 frame can be fitted.
